Alas, Poor Darwin, edited by sociologist Hilary Rose and neuroscientist Steven P.R. Rose, collects essays from scientists and social critics united in their disdain for the extremes of such EP proponents as Richard Dawkins and Edward O. Wilson. Though many writers rely on arguments based on our seemingly innate revulsion for determinism, often ...

~~Alas Poor Darwin Arguments Against Evolutionary Psychology ...~~

Alas Poor Darwin is frequently ad hominem. It attempts to link the EP perspective with eugenics, even Naziism. Its language is often contemptuous and dismissive. It grossly oversimplifies. From a psychological perspective, it reflects a projected fundamentalism.

At the beginning of the 21st century genes are used to explain almost every aspect of human life, from social inequalities to health, sexuality and criminality. This book offers a criticism of this so called evolutionary psychology, arguing that it rests on shaky empirical evidence, flawed premises and unexamined political presuppositions. The editors have gathered together some of the most eminent and outspoken critics of this fashionable ideology.

"A dazzling journey across the sciences and humanities in search of deep laws to unite them." --The Wall Street Journal One of our greatest living scientists--and the winner of two Pulitzer Prizes for *On Human Nature* and *The Ants*--gives us a work of visionary importance that may be the crowning achievement of his career. In *Consilience* (a word that originally meant "jumping together"), Edward O. Wilson renews the Enlightenment's search for a unified theory of knowledge in disciplines that range from physics to biology, the social sciences and the humanities. Using the natural sciences as his model, Wilson forges dramatic links between fields. He explores the chemistry of the mind and the genetic bases of culture. He postulates the biological principles underlying works of art from cave-drawings to *Lolita*. Presenting the latest findings in prose of wonderful clarity and oratorical eloquence, and synthesizing it into a dazzling whole, *Consilience* is science in the path-clearing traditions of Newton, Einstein, and Richard Feynman.

Our fates lie in our genes and not in the stars, said James Watson, co-discoverer of the structure of DNA. But Watson could not have predicted the scale of the industry now dedicated to this new frontier. Since the launch of the multibillion-dollar Human Genome Project, the biosciences have promised miraculous cures and radical new ways of understanding who we are. But where is the new world we were promised? Now updated with a new afterword, *Genes, Cells and Brains* asks why the promised cornucopia of health benefits

## Read PDF Alas Poor Darwin Arguments Against Evolutionary Psychology

has failed to emerge and reveals the questionable enterprise that has grown out of bioethics. The authors, feminist sociologist Hilary Rose and neuroscientist Steven Rose, examine the establishment of biobanks, the rivalries between public and private gene sequencers, and the rise of stem cell research. The human body is becoming a commodity, and the unfulfilled promises of the science behind this revolution suggest profound failings in genomics itself.

Collects forty-four key segments from the late paleontologist and evolutionary biologist's books, papers, and essays, in a collection that includes an assortment of previously unpublished articles and speeches.

In a book that is both groundbreaking and accessible, Daniel C. Dennett, whom Chet Raymo of *The Boston Globe* calls "one of the most provocative thinkers on the planet," focuses his unerringly logical mind on the theory of natural selection, showing how Darwin's great idea transforms and illuminates our traditional view of humanity's place in the universe. Dennett vividly describes the theory itself and then extends Darwin's vision with impeccable arguments to their often surprising conclusions, challenging the views of some of the most famous scientists of our day.

The powerful individualist and subjectivist turn in anthropology - a turn that cannot be easily separated from larger political processes of neo-liberalism and neo-conservatism - is one factor resulting in notions of the social and of society as becoming little else than empty shells of small or no analytical value. The essays presented here, all by leading anthropologists, take a variety of positions on the matter of the retreat of the social. All demonstrate that if anthropology and other social sciences are to fulfill the task of a critical understanding of the diverse realities in which we all must live, these disciplines will find it impossible to do so without a strong concept of the social.

The essays in this volume present applications of evolutionary psychology in a manner intended to illustrate their relevance to current concerns for social scientists and are aimed at those researchers who, in the editor's opinion, have been missing the evolution-revolution to engage with Darwinian thought.

The relationship between feminism and the biological sciences has always been particularly tense and hostile. Feminists have been inclined not to trust what scientists had to say about the sexes, with science often being pronounced a *Owhite, male enterprise.* But why should feminism and the biological sciences remain at odds? And what might be gained from a reconciliation? In *Who's Afraid of Charles Darwin?* Griet Vandermassen shows that, rather than continuing this enmity, feminism and the biological sciences, and in particular evolutionary psychology, have the potential and the need to become powerful allies. Properly understood, the Darwinian perspective proposed in this volume will become essential to tackling the major issues in feminism.

How much of sexual diversity is the result of nature versus nurture? Prevailing theories today lean heavily toward nature. Now a leading researcher in neuroscience and animal behavior shows how, in recent history, scientific claims about sex and gender differences have reflected the culture of the time. Although the conviction that genetics can explain everything is now widespread, the author demonstrates the interaction of culture and environment in the formation of behavioral traits and so provides an important corrective to popular notions of

## Read PDF Alas Poor Darwin Arguments Against Evolutionary Psychology

reductionism. Starting with a summary of sex and gender studies, Rogers explains the error of sex biasing, especially the once-assumed inferiority of women. She then addresses several modern studies and investigations, some of which assert that sex and gender differences are the product of genetic inheritance and hormones. Rogers uses laboratory evidence from studies of animals that help illustrate the biologically fluid properties of sex and gender. *Sexing the Brain* addresses a variety of topical questions: Are there sex differences in how we think and feel? Is language processed in different parts of the brain in men and women? Do social influences have a stronger influence on sexual behavior than sex hormone levels? Rogers concludes that "our biology does not bind us to remain the same.... We have the ability to change, and the future of sex differences belongs to us."
