Not another book on breadmaking! A forgivable reaction given the length of time over which bread has been made and the number of texts which have been written about the subject. To study breadmaking is to realize that, like many other food processes, it is constantly changing as processing methodologies become increasingly more sophisticated, yet at the same time we realize that we are dealing with a food stuff, the forms of which are very traditional. We can, for example, look at ancient illustrations of breads in manuscripts and paintings and recognize products which we still make today. This contrast of ancient and modern embodied in a single processed foodstuff is part of what makes bread such a unique subject for study. We cannot, for example, say the same for a can of baked beans! Another aspect of the uniqueness of breadmaking lies in the requirement for a thorough understanding of the link between raw materials and processing methods in order to make an edible product. This

is mainly true because of the special properties of wheat proteins, aspects of which are explored in most of the chapters of this book. Wheat is a product of the natural environment, and while breeding and farming practices can modify aspects of wheat quality, we millers and bakers still have to respond to the strong influences of the environment.

The first edition of Breadmaking: Improving quality quickly established itself as an essential purchase for baking professionals and researchers in this area. With comprehensively updated and revised coverage, including six new chapters, the second edition helps readers to understand the latest developments in bread making science and practice. The book opens with two introductory chapters providing an overview of the breadmaking process. Part one focuses on the impacts of wheat and flour quality on bread, covering topics such as wheat chemistry, wheat starch structure, grain quality assessment, milling and wheat breeding. Part two covers dough development and bread ingredients, with chapters on dough aeration and rheology, the use of redox agents and enzymes in breadmaking and water control, among other topics. In part three, the focus shifts to bread sensory quality, shelf life and safety. Topics covered include bread aroma, staling and contamination. Finally, part four looks at particular bread products such as high fibre breads, those made from partially baked and frozen dough and those made from non-wheat flours. With its distinguished editor and international team of contributors, the second edition of Breadmaking: Improving quality is a standard reference for researchers and professionals in the bread industry and all those involved in academic research on breadmaking science and practice. With comprehensively updated and revised coverage, this second edition outlines the latest developments in breadmaking science and practice

The author's aim in writing this book is to integrate currently available knowledge concerning the basic scientific and technological aspects of breadmaking processes with the diverse breadmaking methods used to manufacture bread in Europe and on the North American continent today. To date, the main technological advances have been in process mechanization, starting with oven development, then dough processing or make-up equipment, followed by continuous and batch mixing techniques from the 1950s to the present time. On the engineering side, universal emphasis is now being placed on the application of high technology, in the form of microprocessors, computer-controlled equipment and robotization, the long-term objective being computer integrated manufacture (CIM) with full automation within the large chain bakery groups in the capitalist countries and the state-run collectives of Eastern Europe. The application of these key technologies with biotechnology, as yet only applied to a limited degree in food manufacture, coupled with advances in biochemical and rheological understanding of dough as a biomass for breadmaking, should provide us with more expertise and ability to control the processes with greater efficiency. The application of fermentable substrates and industrial enzymes under strict kinetic control should contribute to improving the flavour characteristics of bread. Current trends towards improving the nutritional contribution of bread to the daily diet are improving the competitive edge of bread as a basic food in the market-place.

comprehensive look at the state-of-the-art in bread making from ingredient to shelf-life, with a focus on the impact of processing on the nutritional value and consumer acceptability of this global staple. The book also includes chapters on new breads and bakery products fortified with plant-processing-by-products and/or natural antioxidants, and explores efforts to improve biotechnological processes and fermentation for bread making. It is an excellent resource for researchers, industry professionals and enterprises hoping to produce enhanced bread products through processing-related nutritional and quality improvements. Addresses gluten free products, organic farming and production techniques, enzymatic and biotechnological techniques, fortification of breads with plant by-products, and phenol-rich substrates Fills the gap in current resources, focusing on the application of new technologies for processing practices Provides a guide to industrial and commercialized applications of innovative breadmaking

Edited by one of the world's leading authorities in the field, Bread Making: Improving Quality reviews key recent research on the ingredients determining bread characteristics. The text discusses what this information means for improved process control and a better, more consistent product. After an introductory review, Part 1 discusses such concepts as the structure and quality of wheat and flour, and methods for measuring quality. Part 2 covers dough formation and its impact on bread's structure and properties. This includes such concepts as foam formation and bread aeration, key ingredients, improving taste and nutritional properties, and the prevention of moulds and mycotoxin contamination.

Winner of the 2014 Guild of Food Writers Award for Cookery Book of the Year. James Morton was surely the people's favourite to win 2012's Great British Bake Off series - with his Fairisle jumpers and eccentric showstoppers, this soft-spoken Scottish medical student won the viewers' hearts if not the trophy. James's real passion is bread-making. He is fascinated by the science of it, the taste of it, the making of it. And in Brilliant Bread he communicates that passion to everyone, demystifying the often daunting process of "proper" bread making. James uses supermarket flour and instant yeast - you can save money by making your own bread. You don't even have to knead! It just takes a bit of patience and a few simple techniques. Using step by step photos, James guides the reader through the how-to of dough making and shaping, with recipes ranging from basic loaves through flatbreads, sourdoughs, sweet doughs, buns, doughnuts, focaccia and pretzels. Inspiring and simple to follow, with James's no-nonsense advice and tips, this book will mean you never buy another sliced white loaf again.
