The understanding that some pesticides are more hazardous than others is well established. Recognition of this is reflected by the World Health Organization (WHO) Recommended Classification of Pesticides by Hazard,

which was first published in 1975. The document classifies pesticides in one of five hazard classes according to their acute toxicity. In 2002, the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) was introduced, which in addition to acute toxicity also provides classification of

chemicals according to their chronic health hazards and environmental hazards.

Over the last five decades pesticides have undoubtedly helped to increase agricultural production and control vectors of disease, however the environmental impact of long term agro-chemical use has been

cause for concern along with the effects on human health. In Pesticides, Graham Matthews begins by looking at the developmental history of pesticides, and how crop protection was achieved before they were in use, how pesticides are registered for use and what happens to pesticides in food and the

The International Plant Protection Convention (IPPC) aims to secure coordinated, effective action to prevent and to control the introduction and spread of pests of plants and plant products. This is achieved through the development and implementation of phytosanitary policies and activities. At a country scale, such

activities are the responsibility of the national plant protection organization (NPPO), which is the official service established by a government to discharge the functions specified by the IPPC. While an NPPO has responsibility for phytosanitary actions, it cannot operate in isolation and relies on engagement with

Pesticides-including herbicides, insecticides, and fungicides-have contributed to substantial increases in crop yields over the past five decades. Properly applied, pesticides contribute to higher yields and improved product quality by

controlling weeds, insects, nematodes, and plant pathogens. In addition, herbicides reduce the amount of labor, machinery, and fuel used for mechanical weed control. However, because pesticides may possess toxic properties, their use often prompts concern about human health and environmental consequences. The

examination of pesticide use trends is critical for informed pesticide policy debate and science-based decisions. This report analyzes pesticide use trends using a new pesticide database compiled from USDA and proprietary data, focusing on 21 crops.
