Nise, is a globally acclaimed textbook on the subject. The text is restructured in a concise and student-friendly manner for the undergraduate courses on electrical, electronics and telecommunication engineering.

The study of control systems engineering is also essential for the students of robotics, mechanical, aeronautics and chemical engineering. The book emphasizes on the basic concepts along with practical application of control systems engineering. The text provides students with an up-to-date resource for analyzing and designing real-world feedback control systems. It offers a balanced treatment of the hardware and software sides of the development of embedded systems, besides discussions on the embedded systems development lifecycle. Students will also find an accessible introduction to hardware debugging and testing in the development process.

Prepared by John H. Nelson and Kenneth C. Kemp, both of the University of Nevada. This manual contains 43 finely tuned experiments chosen to introduce students to basic lab techniques and to illustrate core chemical principles. You can also customize these labs through Catalyst, our custom database program. For more information, visit http://www.pearsoncustom.com/custom-library/catalyst In the Thirteenth Edition, all experiments were carefully edited for accuracy and safety. Pre-labs and questions were revised and several experiments were added or changed. Two of the new experiments had been added to Chapter 11.

If you're involved in cybersecurity as a software developer, forensic investigator, or network administrator, this practical guide shows you how to apply the scientific method when assessing techniques for protecting your information systems. You'll learn how to conduct scientific experiments on everyday tools and procedures, whether you're evaluating corporate security systems, testing your own security product, or looking for bugs in a mobile game. Once author Josiah Dykstra gets you up to speed on the scientific method, he helps you focus on standalone, domain-specific topics, such as cryptography, malware analysis, and system security engineering. The latter chapters include practical case studies that demonstrate how to use available tools to conduct domain-specific scientific experiments. Learn the steps necessary to conduct scientific experiments in cybersecurity Explore fuzzing to test how your software handles various inputs Measure the performance of the Snort intrusion detection system Locate malicious "needles in a haystack" in your network and IT environment Evaluate cryptography design and application in IoT products Conduct an experiment to identify relationships between similar malware binaries Understand system-level security requirements for enterprise networks and web services

Although creativity is often considered an individual ability or activity, innovation in teams and organizations involves collaboration of people with diverse perspectives, knowledge, and skills. The effective development of collaborative innovations and solutions to problems is critical to the success of teams and organizations, but research has also demonstrated many factors which tend to limit the effectiveness of collaborative innovation of groups and teams. This volume highlights recent theoretical, empirical, and practical developments that provide a solid basis for the practice of collaborative innovation and future research. It draws from a broad range of research perspectives including cognition, social influence, groups, teams, creativity, communication, networks, information systems, organizational psychology, engineering, computer science, and the arts. This volume is an important source of information for students, scholars, practitioners, and others interested in understanding the complexity of the group creative process and tapping the creative potential of groups and teams.

This book constitutes the refereed proceedings of the 15th International Conference on Practical Applications of Scalable Multi-Agent Systems, PAAMS 2017, held in Porto, Portugal, in June 2017. The 11 revised full papers, 11 short papers, and 17 Demo papers were carefully reviewed and selected from 63 submissions. The papers report on the application and validation of agent-based models, methods, and technologies in a number of key application areas, including day life and real world, energy and networks, human and trust, markets and bids, models and tools, negotiation and conversation, scalability and resources.
