As engineers and as sports fans, we also appreciate that there is more to good stadium design than just the nuts and bolts. That's why we pioneered world first research into how stadium design can generate atmosphere inside a sports arena. This proved that it is possible to engineer an unrivalled experience for spectators, and in doing so deliver real commercial benefits for our clients.

This book compares two buildings with different technologies and distinct environment from the combined viewpoints of civil engineering and architecture. The first is the most recent building of Columbia University in New York, the Northwest Science Building, a project designed by Rafael Moneo and Dan Brodtkin of Ove Arup. The second one is the Burgo Tower in Oporto, by Eduardo Souto Moura and Rui Furtado of AFA, a building that brings a new perspective to the use of prefabrication technologies with local traditional construction systems. With the detailed analyses of recognized researchers in civil engineering and architecture, this book is a reflection upon the problems and solutions in the design and construction process of a prefabricated building system. This volume, like those to follow, brings together, building research and building design practice to enhance the knowledge of complementarity areas involved in construction, engineering and architecture. This is the first book in a new series "Building Research: Design, Construction and Technologies" which aims to bridge scientific research and professional practice to understand the Building Design problems. In each edition, one or two case studies (recognized buildings in the international design panorama) are analyzed with their authors to assess the design process and the construction development. To understand the problems involved, researchers, engineers and architects, are asked to contribute to this analysis with essays on building research issues, as building technology, construction management, acoustics, maintenance or prefabrication.

The book will be in three sections: 1) a front illustrated essay by David Dillon on the design and constructional history of the stadium 2) a visual "walk-through" of the building, including all the major public spaces and the private behind the scene spaces 3) a focus on the 19 art installations throughout the stadium, with a text by David Pagel.

Why this shape and not that? Why steel instead of concrete or stone? Why put it here and not over there? These are the kinds of questions that David Macaulay asks himself when he observes an architectural wonder. These questions take him back to the basic process of design from which all structures begin, from the realization of a need for the structure to the struggles of the engineers and designers to map out and create the final construction. As only he can, David Macaulay engages readers' imaginations and gets them thinking about structures they see and use every day – bridges, tunnels, skyscrapers, domes, and dams. In Building Big he focuses on the connections between the planning and design problems and the solutions that are finally reached. Whether a structure is imposing or inspiring, he shows us that common sense and logic play just as important a part in architecture as imagination and technology do. As always, Macaulay inspires readers of all ages to look at their world in a new way.
