By 2050 the world's population is projected to grow by one-third, reaching between 9 and 10 billion. With globalization and expected growth in global affluence, a substantial increase in per capita meat, dairy, and fish consumption is also anticipated. The demand for calories from animal products will nearly double, highlighting the critical importance of the world's animal agriculture system. Meeting the nutritional needs of this population and its demand for animal products will require a significant investment of resources as well as policy changes that are supportive of agricultural production. Ensuring sustainable

Dongxun and Bob Zhang introduce a different perspective on the theory of evolution: Life is not only selected by nature but intentionally interacts with it, learning how to better its future. They explain that applying this idea to generally accepted principles of biology can have startling results in your ability to affect your own health—and even your evolution. According to the theory of intended evolution, organisms gather information through sensory experience and use that knowledge to effect change in themselves and their environments. The authors propose that organisms use this saved information to make choices projected to enhance their survival. It is through experience, choices, and action, within a given environment, that life changes itself from moment to moment and

National Institutes of Health Lectures in Biomedical Sciences: Current Topics in Biochemistry is based on a series of lectures dealing with current topics in biochemistry and more biologically or medically oriented topics. These lectures were organized for the benefit of young physicians who had just finished their clinical training but were several years out-of-date with respect to basic scientific research. The lecturers were asked, therefore, to present not only their own contributions to the field but also a

broad review of recent developments in a large area of science. The lectures were surprisingly well attended not only by the associates for whom they had originally been designed but also by a large fraction of the NIH research community, specialists and nonspecialists alike. The lectures in this volume cover the following topics: genetic control of lipid metabolism; mammalian RNA-containing tumor viruses; current directions in research on cyclic AMP; the chemistry and biology of collagen; properties of the protein complex of striated muscle involved in the contractile process; cell surface receptor sites; and membrane structure and function.

consider themselves poor writers or find the writing process difficult. The good news is that you do not have to be a talented writer to produce a good scientific paper, but you do have to be a careful writer. In particular, writing for a peer-reviewed scientific or engineering journal requires learning and executing a specific formula for presenting scientific work. This book is all about teaching the style and conventions of writing for a peer-reviewed scientific journal. From structure to style, titles to tables, abstracts to author lists, this book gives practical advice about the process of writing a paper and getting it published.

statistics and biology departments. The population of students in these courses is a diverse one, with varying preparedness. The book assumes the reader has at least two years of high school algebra, but no previous exposure to statistics is required. Written for individuals who might be fearful of mathematics, this book minimizes the technical difficulties and emphasizes the importance of statistics in scientific investigation. An understanding of underlying design and analysis is stressed. The limitations of the research, design and analytical techniques are discussed, allowing the reader to accurately interpret results. Real data, both processed and raw, are used extensively in examples and exercises. Statistical computing packages - MINITAB, SAS and Stata -

life is more complex than this. In *The Logic of the Body*, Matthew LaPine argues that Protestants must retrieve theological psychology in order to properly understand the emotional life of the human person. With classical and modern resources in tow, LaPine argues that one must not choose between viewing emotions exclusively as either cognitive and volitional on the one hand, or simply a feeling of bodily change on the other. The two "stories" can be reconciled through a robustly theological analysis. In a culture filled with worry and anxiety, *The Logic of the Body* offers a fresh path within the Reformed tradition.
