a disease? What is menopause—a biological or a social construction? Historically one can see that health, disease, and illness are concepts that have been ever fluid. Modern science, sociology, philosophy, even society—among other factors—constantly have these issues under microscopes, learning more, defining and redefining ever more exactly. Yet often that scrutiny, instead of leading toward hard answers, only leads to more questions. The editors have recognized a crucial need for a deeper integration of medicine and philosophy with each other, particularly in an age of dynamically changing medical science—and what it means, medically, philosophically, to be human.

Dr Taylor's book analyses the disease concept as it developed in medical history and seeks to clarify it with the help of concepts largely derived from logical class theories. A solution is proposed to the problem of how to distinguish between the class of 'patients' and the class of 'healthy persons' which corresponds to the actual diagnostic practices of doctors. The earliest theories of disease

postulated concrete entities which exist independently of the body. The notion of disease entity has lost its original ontological connotations and instead its important feature has become the possession of a unitary and self-contained character. Dr Taylor describes the modern theories as essentially 'reactive' in character, that is the symptoms of a disease are the bodily reactions to the 'noxae'. After seeing the subject in its historical content, Dr Taylor goes on to discuss in detail the notion of the classification of diseases, making extensive use of modern views on the logic of classes.

design and illustration of details will shift the minds of the readers from mere classroom discourse to societal context (the space of health issues), to consider the implications of those ideas in a way that could guide health interventions. The elemental strengths are the sociological illustrations from African context, rooted in deep cultural interpretations necessitated because Africa bears a greater brunt of health problems. More so, the classical and current epistemological and theoretical discourse presented in this book are indicative of core themes in medical sociology in particular, but cut across a multidisciplinary realm including health social sciences (e.g., medical anthropology, health psychology, medical demography, medical geography and health economics) and health studies (medicine, public health, epidemiology, bioethics and medical humanities) in general. Therefore, apart from the book's

What counts as health or ill health? How do we deal with the fallibility of our own bodies? Should illness and disease be considered simply in biological terms, or should considerations of its emotional impact dictate our treatment of it? Our understanding of health and illness had become increasingly more complex in the modern world, as we are able to use medicine not only to fight disease but to control other aspects of our bodies, whether mood, blood pressure, or cholesterol. This collection of essays foregrounds

Special emphasis is given to the lay perspective to show how people themselves think about and experience health. Blaxter guides students through all the relevant conceptual models of the relationship of health to the structure of society, from inequality in health to the ideas of the risk society, the "socio-biological translation" and the contribution of health to social capital. The book concludes with a comprehensively revised and thought-provoking discussion of the impact of new technology, the boundaries between life and death, modern commodification of health, technological transformations of the body and theories of evolutionary biology.
