The basic idea behind using a duct leakage tester to test for duct leakage is: Use a calibrated fan to pressurize the duct system. Measure the airflow through the fan with the duct system at pressure. Just as when you're testing for airtightness, each cubic foot of air that leaks out (of the duct system in this case) must be made up by a cubic foot of air blown in by the fan. So, once you've measured the amount of

First, you need to determine if a duct leakage test is required. The only time duct testing is required is when parts of the HVAC system are outside of the conditioned envelope. This includes areas like unconditioned attics, garages, and crawlspaces. If any supply or return duct chases, flexible lines or air handler units are in these areas, by IECC 2015 code, a duct leakage test is required.

IRC 2015 N1103.3.4 allows the following duct leakage: Rough In Test – less than 4 cfm per 100 sq ft which for my house is about 160 cfm if the air handler is included in the leakage test. However our local Utah code has a carve out allowing 7 cfm per 100 sq ft. So we are way better than Utah code and a little under the 2015 IRC code.

systems, and the surrounding outdoor environment all play a role in the performance of a building. Duct Leakage Testing covers: * Duct leakage testing methods or total leakage. * Leakage to the outside using a duct pressurization tester. * Modified blower door subtraction methods.

The thermal distribution system couples the HVAC components to the building envelope, and shares many properties of the buildings envelope including moisture, conduction and most especially air leakage performance. Duct leakage has a strong influence on air flow rates through building envelopes (usually resulting in much greater flows than those due to

natural infiltration) because unbalanced duct air flows and leaks result in building pressurization and depressurization. As a tool to estimate this effect, the DeltaQ duct leakage test has been developed over the past several years as an improvement to existing duct pressurization tests. It focuses on measuring the air leakage flows to outside at operating conditions that are required for envelope infiltration impacts and energy loss calculations for duct systems. The DeltaQ test builds on the standard envelope tightness blower door measurement techniques by repeating the tests with the system air handler off and on. The DeltaQ test requires several assumptions to be made about duct leakage and its interaction with the duct system

and building envelope in order to convert the blower door results into duct leakage at system operating conditions. This study examined improvements to the DeltaQ test that account for some of these assumptions using a duct system and building envelope in a test laboratory. The laboratory measurements used a purpose-built test chamber coupled to a duct system typical of forced air systems in US homes. Special duct leaks with controlled air-flow were designed and installed into an airtight duct system. This test apparatus allowed the systematic variation of the duct and envelope leakage and accurate measurement of the duct leakage flows for comparison to DeltaQ test results. This paper will
