Trauma and Orthopaedics at a Glance is an easy-to-read, highly visual guide to orthopaedics. It comprehensively covers relevant basic science and clinically-oriented anatomy of the musculoskeletal system, and the diagnosis and management of trauma, sports injuries, paediatric orthopaedics, degenerative disease, and musculoskeletal tumours. Although primarily aimed at junior doctors and senior medical students, it is also useful for physiotherapists and nurse practitioners. Trauma and Orthopaedics at a Glance: • Provides thorough coverage of diagnosis, investigation and contemporary treatment options of commonly encountered orthopaedic conditions; • Features a section on what to expect as a Foundation doctor in orthopaedics, including how to present cases in trauma meetings, essential information to survive 'on-call' shifts and tips for efficient clerking of trauma admissions; • Unique 'how to' section, comprising guidance on key practical procedures such as aspirating joints, manipulating fractures and applying plaster casts. • Includes a companion website at ataglanceseries.com/tando featuring 120 multiple-choice questions and 10 case studies This brand new title presents an overview of all the information relating to diagnosing and treating musculoskeletal conditions, and is ideal while on rotation or revising key concepts.

Few if any medical fields share the complexity of injuries and the number of available treatments that exist in orthopaedic trauma. Deciding on the most efficacious treatment can often be difficult. In this digital age with a tsunami of medical information and conflicting data on numerous approaches, practitioners who treat orthopaedic trauma often find it problematic to make "evidence-based" choices. Decision Making in Orthopaedic Trauma is the largest compendium of orthopaedic trauma algorithms assembled to date. The decision trees cover a broad spectrum of cases - from simple isolated fractures - to severe, life-threatening conditions. The decisions on which action to perform in each situation are largely based on the personal experiences of the individual authors, all members of the University of California, San Francisco (UCSF) / Zuckerberg San Francisco General (ZSFG) Orthopaedic Trauma Institute. When the decisions are supported by published scientific literature, the relevant publications are cited. Visually appealing, easy-to-comprehend decision trees detail underlying pathologies, suspected diagnoses, required imaging studies, possible treatment approaches, rehabilitation, expected outcomes, and postsurgical care. The format is more conducive to swiftly acquiring knowledge and making informed decisions than traditional texts and websites. Key Features Management of a wide range of emergencies including compartment syndrome, open fractures, peripheral nerve injuries, mangled extremities, and multiple trauma Perioperative care - from acute and chronic pain management - to venous thromboembolism prevention and the use of regional anesthesia Major sections organized by anatomic region cover upper extremity, lower extremity, pelvic, hip, and spine trauma Clinical pearls on the management of osteoporotic, neoplastic, and periprosthetic fractures and fracture complications Impacted anatomy, differential diagnoses, and possible approaches visualized through high-quality color illustrations and radiographs Consistent color scheme differentiates actions, imaging, and rehabilitation guidelines Appendices provide a quick reference on imaging, bracing, and rehabilitation recommendations This uniquely formatted, visually rich book will enable surgeons, physicians, and residents to understand and apply critical decisions to a wide range of fractures, dislocations, nerve injuries, and musculoskeletal complications.

Orthopedic Trauma Care is a valuable resource for optimizing the care of orthopedic trauma patients. The book begins by presenting classification, wound and fracture healing, principles of fracture treatment, and information on the care of polytrauma patients. It closes with details on specific injuries and common complications and syndromes secondary to traumatic injuries.

Fully illustrated throughout with a wide range of scans, images and line drawings, ABC of Orthopaedics and Trauma provides practical guidance on the diagnosis, treatment and management of orthopaedic conditions, and assists with the initial assessment based on common presentations. Written by a team of renowned expert orthopaedic surgeons and rheumatologists, it includes coverage of the current national guidelines from NICE and professional bodies. Twenty-four chapters cover all the major areas of this vast speciality using a digestible and reader-friendly approach, including sections on fractures, joint replacements, rheumatological disorders, osteoarthritis, emergencies, and post-operative care. Introduction to specialist topics like metabolic bone disease, peripheral nerve injury, paediatric orthopaedics and tumours are also featured. Topics consist of history and examination, investigation and initial management of common orthopaedic trauma and elective presentations. In addition, this full-colour, user-friendly reference guide offers readers a look at the day-to-day clinical practice of a speciality that will affect at least half of the global population at some point, covering further chapters on epidemiology, biomechanics, common procedures, future developments and education. ABC of Orthopaedics and Trauma is an excellent resource for all healthcare professionals caring for patients with musculoskeletal and orthopaedic related disorders. This will be a valuable reference to orthopaedic trainees, sports physicians, physiotherapists, nurses, occupational therapists, clinical researchers and student doctors.

Making a correct diagnosis is one of the key aspects of every medical student's and junior doctor's clinical training, and problem-based learning is now widely used to focus on the causes behind the presentation of a clinical feature. The Fourth Edition of this best-selling book is packed full of information to help the reader move from a presenting problem to an accurate diagnosis. This Fourth Edition covers 127 common presenting problems in both medicine and surgery in a consistent format. Each topic includes a list of all potential causes of the condition, colour coded to indicate common, occasional or rare causes. Important geographical variations are also highlighted. Two sections cover the differential diagnosis of biochemical and haematological disorders which provide a ready check when reviewing abnormal results. The text includes a targeted guide to the relevant general and specific follow-up investigations which should be carried out as appropriate. At the end of each topic a box highlights important learning points, or indicates symptom and signs suggestive of significant pathology which require urgent action. Eighty colour photographs of key clinical presentations have been added to assist symptom recognition. Two new chapters on Hypotension and Photophobia.

This text provides the clinician with a step-by-step guide to performing the most common musculoskeletal procedures. It lists the steps required to properly treat both patients with acute injuries in the emergency room and degenerative conditions in the office. Each procedure is described from start to finish, with recommended anesthesia techniques, patient positioning, steps required to complete each task, and proper immobilization (if required).
