Serious. For established medical conditions, researchers found that it did not make a difference in perception if a lay term was used or if subjects were presented with the medicalized language. However, when study participants were presented with the recently medicalized term for common conditions, the ailments were perceived to be more severe, more likely to be a disease and more likely to be rare, compared with the same disorder presented with its synonymous lay label.

noun Word forms: plural lay persons, lay people, laypersons or laypeople. 1. a person who is not a member of the clergy. 2. a person who does not have specialized or professional knowledge of a subject. a lay person's guide to conveyancing. Collins English Dictionary. Copyright © HarperCollins Publishers.

The current volume represents a revival of Arabic translation and terminology studies. These disciplines have been dominated by Western scholarship in recent decades, but in truth their historical tradition as a whole owes a great debt to Arabic scholarship. The first systematic translation activity ever organized was under the Abbasids in Baghdad in the 9th Century CE, and Arabic domination continued for several centuries before the tide turned. In this collection, the importance of the ongoing translation and terminology movement in the Arab world is revealed through the works of some of the most distinguished scholars, who investigate a wide range of relevant topics from the making of the first ever Arabic monolingual dictionary to modern-day localization into Arabic. Arabic terminology standardization as well as legal, medical, Sufi and Quranic terms – issues with both cultural and economic ramifications for the Arab world – are thoroughly examined, completing the solid framework of this rich tradition that still has a lot to offer.

This dissertation, "The Effects of Chinese Medical Terms on Patient Comprehension of Information in a Simulated Clinical Consultation" by Yingli, Wu, ???, was obtained from The University of Hong Kong (Pokfulam, Hong Kong) and is being sold pursuant to Creative Commons: Attribution 3.0 Hong Kong License. The content of this dissertation has not been altered in any way. We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation. All rights not granted by the above license are retained by the author. Abstract: Doctor's use of medical terms is generally considered to be one of the reasons for patients' poor comprehension

of medical information. However, little research has been done on the effects of Chinese medical terms, which are constructed rather differently compared to English medical terms. This study manipulated the use of Chinese medical terms in a simulated clinical consultation, to investigate its effects on patients' comprehension of medical information and their confidence for seeking further information. One hundred and eighty one eligible Hong Kong laypersons were randomly assigned to watch one of three video clips, which differed in the use of words explaining the underlying pathological changes and the treatment of prolapsed intervertebral disc: one with lay terms only (group 1), another with medical terms alone (group 2), and another one with medical terms supplemented with lay terms (group 3). After that, a computer-based questionnaire was used to assess the participants' comprehension of the information and confidence for seeking further information, followed by a semi-structured face-to-face interview on their perceptions of the utility of Chinese medical terms. Results suggested that although Chinese medical terms were perceived to be useful in assisting patients to look for further information on their diseases, the use of Chinese medical terms, either used with or without the supplements of lay terms, did not add to patients' comprehension of medical information and confidence for seeking further information. Regression models showed a significant trend of decreasing comprehension of the cause of the disease ( $\beta = -0.241$ ,  $P = 0.002$ ) and knowledge test scores ( $\beta = -0.214$ ,  $P = 0.006$ ) with increasing age of the participant. However, older persons had better comprehension of the word used ( $\beta = 0.238$ ,  $P = 0.001$ ). Participants' educational level was the most important determinant of knowledge test scores ( $\beta = 0.364$ ,  $P = 0.001$ ). The findings of the study have implications for doctor-patient communication as well as medical education. To improve the effectiveness of doctor-patient communication, it may be more rewarding to enhance doctors' overall communication skills, rather than simply advocating their use or not use of medical language.
