Book presents non-executive directors of primary care trusts with a guide to the NHS, the role they have to play and the expectations they will have and others have of them. This is not a 'how to do it' book - it cuts a path through some of the long grass that the NHS inhabits. The aim is to help non-execs get where they want with a minimum of fuss and jargon.

Fifty years ago medicine was straightforward. Doctors had limited therapeutic options and patients did as they were told. Today, an array of medical interventions is putting increasing pressure on limited resources, patients are questioning everything and doctors are uncertain of their role. Health economists hoped to offer important insights to aid decision making, but their technical frameworks bore little resemblance to the practical requirements of end users. Now, this book presents the concepts and insights that health economics has to offer in a way that is accessible to every healthcare decision maker. Getting Health Economics into Practice is for all those who are involved in the planning, commissioning and delivery of healthcare. It illuminates the practical value that the concepts and principles of health economics can offer decision makers at all levels. Comprehensive and extensive, it is the first such book to be edited by a clinician rather than a health economist, with contributions from an expert panel of specialists. This approach ensures it is accessible and useful in the everyday work of health professionals. It is relevant for all healthcare sectors, in particular for Primary Care Trusts, and is essential reading for managers, researchers, and especially practitioners.

This new edition incorporates revised guidance from H.M Treasury which is designed to promote efficient policy development and resource allocation across government through the use of a thorough, long-term and analytically robust approach to the appraisal and evaluation of public service projects before significant funds are committed. It is the first edition to have been aided by a consultation process in order to ensure the guidance is clearer and more closely tailored to suit the needs of users.

This book provides a comprehensive set of instructions and examples of how to perform a cost-benefit analysis (CBA) of a health intervention, with a particular focus on the use of stated preference survey

methods to identify consumer preference data and the use of recent developments in cost-effectiveness analysis within a CBA framework.

Diagnosis Related Group (DRG) systems were introduced in Europe to increase the transparency of services provided by hospitals and to incentivise greater efficiency in the use of resources invested in acute hospitals. In many countries, these systems were also designed to contribute to improving – or at least protecting – the quality of care. After more than a decade of experience with using DRGs in Europe, this book considers whether the extensive use of DRGs has contributed towards achieving these objectives. Written by authors with extensive experience of these systems, this book is a product of the EuroDRG project and constitutes an important resource for health policy-makers and researchers from Europe and beyond. The book is intended to contribute to the emergence of a ‘common language’ that will facilitate communication between researchers and policy-makers interested in improving the functioning and resourcing of the acute hospital sector. The book includes:

- A clearly structured introduction to the main ‘building blocks’ of DRG systems
- An overview of key issues related to DRGs including their impact on efficiency, quality, unintended effects and technological innovation in health care
- 12 country chapters - Austria, England, Estonia, Finland, France, Germany, Ireland, the Netherlands, Poland, Portugal, Spain and Sweden
- Clearly structured and detailed information about the most important DRG system characteristics in each of these countries
- Useful insights for countries and regions in Europe and beyond interested in introducing, extending and/ or optimising DRG systems within the hospital sector

This topical and timely book presents an innovative approach to dealing with the complexities of cost planning in PFI. PFI/PPP projects have a significantly different costing environment from conventionally procured projects, requiring cost analysts to use their expertise and innovative thinking to develop whole-life cost solutions that deliver value for money to the client, thus improving public building assets performance. Abdelhalim Boussabaine provides a thorough grounding in the theory of PFI, from its early evolution through to examples of current projects. In particular, the rationale for private financing of public services, arguments for and against PFI and 'value for money' mechanisms are discussed. The book presents an innovative framework for whole-life value and calls for changes in the way whole life cycle value is perceived, created and exchanged. *Cost Planning of PFI and PPP Building Projects* provides the reader with existing knowledge as well as present innovative thinking for future development and management of PFI/PPP cost planning processes. Given the importance and novelty of this book, academics, professionals, undergraduate and postgraduate students will find this book valuable.

Clinical Pharmacy Education, Practice and Research offers readers a solid foundation in clinical pharmacy and related sciences through contributions by 83 leading experts in the field from 25 countries. This book stresses educational approaches that empower pharmacists with patient care and research competencies. The learning objectives and writing style of the book focus on clarifying the concepts comprehensively for a pharmacist, from regular patient counseling to pharmacogenomics practice. It covers all interesting topics a pharmacist should know. This book serves as a basis to standardize and coordinate learning to practice, explaining basics and using self-learning strategies through online resources or other advanced texts. With an educational approach, it guides pharmacy students and pharmacists to learn quickly and apply. *Clinical Pharmacy Education, Practice and Research* provides an essential foundation for pharmacy students and pharmacists globally. Covers the core information needed for pharmacy practice courses Includes multiple case studies and practical situations with 70% focused on practical clinical pharmacology knowledge Designed for educational settings, but also useful as a refresher for advanced students and researchers

This publication sets out guidance for the NHS and private sector on the production of accurate capital

cost estimates at different stages of cost planning, to underpin the business case for delivering NHS capital schemes. It examines the Outline Business Case (OBC) forms and demonstrates the methodology of building up the cost of a scheme based on a hypothetical District General Hospital, as well as discussing each element of the business case form and how standard information can be used.

The authoritative guide for dietetic students and both new and experienced dietitians – endorsed by the British Dietetic Association Now in its sixth edition, the bestselling Manual of Dietetic Practice has been thoroughly revised and updated to include the most recent developments and research on the topic. Published on behalf of the British Dietetic Association, this comprehensive resource covers the entire dietetics curriculum, and is an ideal reference text for healthcare professionals to develop their expertise and specialist skills in the realm of dietetic practice. This important guide includes: The latest developments and scientific evidence in the field New data on nutrition and health surveillance programs Revised and updated evidence-based guidelines for dietetic practice An exploration of how Public Health England has influenced the field Practical advice on public health interventions and monitoring A companion website with helpful materials to support and develop learning Written for dietitians, clinical nutritionists, and other healthcare professionals by leading dietitians and other professionals, the Manual of Dietetic Practice continues to provide a crucial resource for experts and novices alike.

The study is the result of the research on the transaction costs of the pricing of health services. Due to the fact that the regulations in terms of pricing include activities that lead to price-setting of a good (health service), costs associated with these activities should be treated as transaction costs. According to the assumptions of classical economics, the price should be set at the intersection of the supply and demand curve under the assumption of full information and rationality of market participants. The primary objective of the study is to identify the transaction costs occurring during the pricing of health services (and relate these cost to the institutional environment and the organization of pricing transaction) and characterize the factors that affect the level of transaction costs – to present the force and direction of the relationship between each of the factors and the level of transaction costs. An additional objective of this study is to link the conclusions about the level of transaction costs to the conclusions regarding the accuracy of the cost-based pricing in health care. The accuracy of the pricing system is related to the degree to which the price structure reflects the actual cost structure of the health services. The institutional approach will add up to the existing research on the importance of cost information for the pricing of health services. The empirical part of the work was carried out based on the analysis of primary and secondary sources. Its aim was to present how pricing is organized in seventeen countries selected.
