NOTE : Windows 7 users won ' t be able to use some latest features of eCatalog/WOS since Microsoft is ending support for Windows 7 on 14 Jan, 2020.

Vols. for 1970-71 includes manufacturers' catalogs.

The value of the critical temperature (T_c), below which the thermal explosion of a chemical cannot occur, is indispensable to prevent such a chemical from exploding. In order to determine the T_c it has so far been necessary to measure the value in explosion experiments. Because of the inherent hazards, only few T_c values are available at present. Critical Temperatures for the Thermal Explosion of Chemicals introduces new and simple procedures to calculate the T_c . As a result T_c can be calculated for a range of chemicals, many of which are listed in this new volume. The calculated values of T_c are shown to be in agreement with experimentally determined values. The data and methods presented in Critical Temperatures for the Thermal Explosion of Chemicals will be of use to research laboratories as well as in the chemical industry. Introduces new and simple procedures for calculating critical temperatures Lists the $T(c)$ values of chemicals in tables Explains mathematical expressions in clear simple terms

This basic source for identification of U.S. manufacturers is arranged by product in a large multi-volume set. Includes: Products & services, Company profiles and Catalog file.
