This book was written for new designers looking for a solid foundation in PCB design although designers with more experience will find the reference material, software, and explanations of the values that manufacturers use invaluable as well.

This book presents a practical approach to pro-environmental challenges faced by companies in the process of restructuring. It contains a broad variety of case studies from different economic sectors, and small and large businesses, in four European countries: Ukraine, Romania, Germany and Poland. The studies are the results of surveys of companies that had either already restructured or were planning to, and reveal both the weaknesses and strengths in these practices. The book is divided into three parts: explorations of how political and legal factors are embedded in a company ' s strategy and how they influence the company ' s behaviour; analyses of companies ' activities on matching restructuring with ecology; and approaches to ecoinnovations within the companies. The case studies throughout the book show that the restructuring of a company is an opportunity for the implementation of proecological action and “ green ” business models. The authors trust that the experiences and good practices of others will prove valuable both for future businessmen (i.e. students), but also for academics and representatives of local government, central environmental agencies, owners and managers of enterprises to be restructured.

The Study Guide For Calculated Industries Master Pro Calculator is a must-have study guide to accompany the Calculated Industries Master Pro Calculator. This study guide conveys the fundamentals of the most complete builder's calculator on the market. Check out our app, DEWALT® Mobile Pro(tm). This free app is a construction calculator with integrated reference materials and access to hundreds of additional calculations as add-ons. To learn more, visit dewalt.com/mobilepro.

This multimedia eBook establishes a solid foundation in the essential principles of how signals interact with transmission lines, how the physical design of interconnects affects transmission line properties, and how to interpret single-ended and differential time domain reflection (TDR) measurements to extract important figures of merits and avoid common mistakes. This book presents an intuitive understanding of transmission lines. Instructional videos are provided in

every chapter that cover important aspects of the interconnect design and characterization process. This video eBook helps establish foundations for designing and characterizing the electrical properties of interconnects to explain in a simplified way how signals propagate and interact with interconnects and how the physical design of transmission structures will impact performance. Never be intimidated by impedance or differential pairs again.

This comprehensive revision begins with a review of static electric and magnetic fields, providing a wealth of results useful for static and time-dependent fields problems in which the size of the device is small compared with a wavelength. Some of the static results such as inductance of transmission lines calculations can be used for microwave frequencies. Familiarity with vector operations, including divergence and curl, are developed in context in the chapters on statics. Packed with useful derivations and applications.

Complicated concepts explained succinctly and in laymen's terms to both experienced and novice PCB designers. Numerous examples allow reader to visualize how high-end software simulators see various types of SI problems and then their solutions. Author is a frequent and recognized seminar leader in the industry.

Input/Output (IO) circuits enable interface between logic circuitry and the actual or raw information to be processed. They also help to isolate the integrated circuit from the unsafe, unknown and noisy environment. IOs come in many flavors and the General Purpose IO (GPIO) is one among them. GPIOs can operate as an input, output or a bi-directional circuit. The purpose of this work is to design an area optimized industrial quality bi-directional GPIO with separate enable signal for transmitter and receiver which can drive a current of at least 16 mA into the PAD (the circuit point where the capacitive load is connected). The typical IO power level (the power at which a Printed Circuit Board, PCB operates) is 1.8 V and the core (the logic circuitry) power level is 1.0 V. Drive strength control and slew rate control are included in the GPIO implementation. Since many GPIOs could be placed in an IO ring (IOs placed around the periphery of the chip), its placement optimization is important for optimal chip area, as well as, robust IO ring from performance and qualification requirements. IOs need to be protected from ESD events. One of the key ESD protection methodologies involve accurate ESD device sizing versus ESD current path distance optimization. A calculator is developed to predict the optimum distance at which a power clamp should be present for a given IO ESD device size and overall current carrying element availability. This tool is supposed to get certain inputs regarding the ESD protection devices from the user and suggest an optimum distance at which a power clamp should be placed in an IO ring. This work is intended to produce one of the most compact GPIOs in the given technology node (the distance between source and drain of the CMOS transistor), 28 nm and a clamp placement calculator which works for different technology nodes.
