Cantilever retaining wall is the most common type of earth-retaining structure. It is constructed of reinforced Portland-cement concrete (PCC) was the predominant type of rigid retaining wall used from about the 1920s to 1970s. Earth slopes and earth retaining structures are used to maintain two different ground surface elevations.

Cantilever Retaining Wall - Functions and Design ...

The cantilever retaining wall shown below is backfilled with granular material having a unit weight, γ , of 19 kNm³. and an internal angle of friction, ϕ , of 30°. Assuming that the allowable bearing pressure of the soil is 120 kNm², the coefficient of friction is 0.4 and the unit weight of reinforced concrete is 24 kNm³.

Example 3.16 Design of a cantilever retaining wall (BS 8 110)

In cantilever retaining walls, the concrete base or footing holds the vertical masonry wall in position and resists overturning and sliding caused by lateral soil loading. The reinforcement is placed vertically in the cores of the masonry units to resist the tensile stresses developed by the lateral earth pressure.

Gravity wall-Masonry or Plain concrete 2. Cantilever retaining wall-RCC (Inverted T and L) 3. Counterfort retaining wall-RCC 4.

DESIGN AND DETAILING OF RETAINING WALLS

Cantilever retaining walls are constructed of reinforced concrete. They consist of a relatively thin stem and a base slab. The base is also divided into two parts, the heel and toe. The heel is the part of the base under the backfill.

DESIGN OF RETAINING WALLS

Cantilever retaining walls can be precast in a factory or formed on site and considered economical up to about 25 ft in height. This design example focuses on the analysis and design of a tapered cantilever retaining wall including a comparison with model results from the engineering software programs spWall and spMats.

Cantilever retaining walls use the weight of the backfill material to resist soil pressure. Less building material is required for a cantilevered wall than a gravity wall, and they can be poured onsite or precast. They consist of a relatively thin stem (often tapered) and a base slab, which is divided into two parts: the heel and toe.

Worked examples of retaining wall design to BS8002 The following worked examples have been prepared to illustrate the application of BS8002 to retaining wall design. They are not full detailed calculations such as might be prepared for a real wall design but are limited to the calculation of earth pressure and bearing capacity, showing how the recommendations of BS8002 are applied in practice.

This thesis presents a lucid model to obtain the optimum cost of a cantilever retaining wall having different cases of backfill (straight and inclined) and surcharge. A code written in Java, finds out all the sections of the cantilever retaining wall possible according to stability criteria that applies to all retaining walls and gives the optimum cost of a retaining wall of a given height and the required material properties to be used, while following the provisions of the Indian Standard Code, IS 456:2000 for the sections. The freedom given for the person who uses the program to specify material properties and their costs add to the versatility of the code.

UPDATED AND EXPANDED NEW 11TH EDITION. Design guide for earth retaining structures covers nearly every type of earth retaining structure: cantilevered, counterfort, restrained (basement walls), gravity, segmental, sheet pile, soldier pile, and others. Current building code requirements are referenced throughout. Topics include types of retaining structures, basic soil mechanics, design of concrete and masonry walls, lateral earth pressures, seismic design, surcharges, pile and pier foundations, Gabion walls and swimming pool walls. Detailed drawings along with carefully chosen examples, many of them from examination papers, greatly facilitate the understanding of the subject.

This book covers different aspects of real-world applications of optimization algorithms. It provides insights from the Sixth International Conference on Harmony Search, Soft Computing and Applications held at Istanbul University, Turkey, in July 2020. Harmony Search (HS) is one of the most popular metaheuristic algorithms, developed in 2001 by Prof. Joong Hoon Kim and Prof. Zong Woo Geem, that mimics the improvisation process of jazz musicians to seek the best harmony. The book consists of research articles on novel and newly proposed optimization algorithms; the theoretical study of nature-inspired optimization algorithms; numerically established results of nature-inspired optimization algorithms; and real-world applications of optimization algorithms and synthetic benchmarking of optimization algorithms.
