In his latest book, Michael Betancourt explores the nature and role of typography in motion graphics as a way to consider its distinction from static design, using the concept of the 'reading-image' to model the ways that motion typography dramatizes the process of reading and audience recognition of language on-screen. Using both classic and contemporary title sequences—including The Man With the Golden Arm (1955), Alien (1979), Flubber (1998), Six Feet Under (2001), The Number 23 (2007) and Scott Pilgrim vs. The World (2010)—Betancourt develops an argument about what distinguishes motion graphics from graphic design. Moving beyond title sequences, Betancourt also analyzes moving or kinetic typography in logo designs, commercials, film trailers, and information graphics, offering a striking theoretical model for understanding typography in media.

This book develops a critical and theoretical approach to the semiotics of motion pictures as they are applied to a broader range of constructions than traditional commercial narrative productions. This interdisciplinary approach begins with the problems posed by motion perception to develop a model of cinematic interpretation that includes both narrative and non-narrative types of productions. Contrasting traditional theatrical projection and varieties of new media, this book integrates analyses of title sequences, music videos, and visual effects with discussions on classic and avant-garde films. It further explores the intersection between formative audio-visual cues identified by viewers and how viewers' desires direct engagement with the motion picture to present a framework for understanding cinematic articulation. This new theoretical model incorporates much of what was neglected and gives greater prominence to formerly critical marginal productions by showing the fundamental connections that link all moving imagery and animated text, whether it tells a story or not. This insightful work will appeal to students and academics in film and media studies.

A behind-the-scenes history of computer graphics, featuring a cast of math nerds, avant-garde artists, cold warriors, hippies, video game players, and studio executives. Computer graphics (or CG) has changed the way we experience the art of moving images. Computer graphics is the difference between Steamboat Willie and Buzz Lightyear, between ping pong and PONG. It began in 1963 when an MIT graduate student named Ivan Sutherland created Sketchpad, the first true computer animation program. Sutherland noted: "Since motion can be put into Sketchpad drawings, it might be exciting to try making cartoons." This book, the first full-length history of CG, shows us how Sutherland's seemingly offhand idea grew into a multibillion dollar industry. In Moving Innovation, Tom Sito—himself an animator and industry insider for more than thirty years—describes the evolution of CG. His story features a memorable cast of characters—math nerds, avant-garde artists, cold warriors, hippies, video game enthusiasts, and studio executives: disparate types united by a common vision. Sito shows us how fifty years of work by this motley crew made movies like Toy Story and Avatar possible.
